

HiliteColor

Choose new highlighting color

#include <Quickdraw.h>**Color Quickdraw**

```
void      HiliteColor( color );  
RGBColor *RGBColor ;           requested red, green, blue components
```

HiliteColor lets you change the highlighting color used by current cGrafPort.

RGBColor is a record type which specifies a color's red, green, and blue components as 16-bit unsigned integers.

Returns: none

Notes: Highlight color is used whenever a drawing operation uses the highlight transfer mode. A cGrafPort's highlight colors are initialized from the HiliteRGB global variable stored in the port's **grafVars** handle.
