

**SetChooserAlert**                      Bypass page resetup message

#include <Devices.h>

**Device Manager**

Boolean                      **SetChooserAlert**(*f* );  
Boolean                      *f* ;                      True = Chooser puts up the page setup alert  
  
                                 ***returns***                      The original alert state

**SetChooserAlert** lets an application bypass the warning message that normally appears whenever a new printer type is selected and which tells the user to confirm the printer's settings.

*f* is a Boolean value indicating that either the warning message should be displayed or not.

**Returns:** a Boolean; it indicates what the original alert state was.

---

Notes: Your program, if it is going to handle page setup by itself and you don't want the warning displayed, should make sure that the original state is restored when it exits.
