

PrStlInit

Obtain address of an initialized TPrDlg structure

#include <PrintTraps.h>

Printing Manager

TPrDlg **PrStlInit**(*hPrtRec*);
THPrint *hPrtRec* ; handle leading to a TPrint structure
 returns address of a variable-length TPrDlg structure.

PrStlInit is called automatically by the Printing Manager when you call **PrStlDialog**. Applications may call it as part of a complicated kludge to modify the standard "Page Setup..." dialog. There is a detailed discussion of this in Adding Items to the Print Dialogs.

hPrtRec is a handle leading to a 120-byte TPrint structure, as previously prepared by a call to **PrintDefault** or **PrValidate**.

Returns: the address of a TPrDlg structure. The structure includes a DialogRecord and other fields previously initialized for a call to **ModalDialog**.

Notes: This function is documented in Macintosh Technical Note #95, which describes a technique for adding items to the standard "Print..." and "Page Setup..." dialogs.

See **PrDlgMain** and TPrDlg for related information.
