

**DXInfo** structure

#include &lt;Files.h&gt;

typedef struct <b>DXInfo</b> {		<u>Size</u>	<u>Offset</u>	<u>Description</u>
<u>Point</u> frScroll;		4	0	Currently scrolled by this horiz and vert amt
<u>long</u> frOpenChain;		4	4	Directory ID in the chain of open folders
<u>short</u> frUnused;		2	8	(reserved)
<u>short</u> frComment;		2	10	Resource ID of folder's comment (type 'FCMT')
<u>long</u> frPutAway;		4	12	Dir ID of folder's home directory
} <b>DXInfo</b> ;		16		

Notes: A DXInfo structure named ioDrFndrInfo is embedded in the DirInfo structure obtained by PBGetCatInfo. Field values in it can be set via PBSetCatInfo.

The frScroll field is the horizontal and vertical distance by which the contents of the folder are currently scrolled.

The frComment field contains the resource ID of an 'FCMT' in the Desktop file. It is a Pascal string which gets displayed/modified in the Finder's "Get Info" menu item dialog.

The frPutAway field is a 'hard' directory ID of the folder in which this folder is normally displayed. When a folder gets moved to the desktop, the Finder uses this field to implement its "Put Away" menu item.
