

IUMetric

See if measurements should use metric units

#include <Packages.h>

International Utilities PackageBoolean**IUMetric();*****returns***

Does this country use metric units?

IUMetric checks 'INTL' resource 0 and returns an indication of whether the country described therein uses the metric system.

Returns: a Boolean; it identifies the standard units of measurement for the current country:

FALSE Use a system other than metric.

TRUE Use metric measurements.

Notes: If your application draws a ruler, or otherwise shows units of measurement, you should call **IUMetric** to help you decide on a default style of measurement.

This function echoes the value stored in the metricSys field of the Intl0Rec structure obtained via **IUGetIntl(0)**.
