

BOff Switch off power to SCC and -5 volt supply if portA not in use

#include <Power.h>

Power Manager

void **BOff**(void);
 returns none

The **BOff** procedure switches off power to the SCC and the -5 volt supply if serial port A is not in use. If the internal modem is installed, connected to port B, and switched on, this procedure switches off power to the modem. Otherwise, the **BOff** procedure switches off power to the serial driver chips, unless they are being used by port A.
