

SetCurrentA5 Get the current value of A5.

#include <OSUtils.h>

Memory Manager

long **SetCurrentA5** (*void*);
 returns Error Code; 0=no error

Use **SetCurrentA5** to get the current value of the system global variable CurrentA5.

The **SetCurrentA5** function does two things: First, it gets your application's A5 and returns it to your application. Second, **SetCurrentA5** sets register A5 to the value of the application's low-memory global variable CurrentA5.
