GetTime   Get current date and time in DateTimeRec format

#include <<u>OSUtils.h</u>>   **Operating System Utilities**

```
void            GetTime( dtrp );
DateTimeRec     *dtrp ;          receives date and time
```

    GetTime obtains the current date and time in the form a <u>DateTimeRec</u> structure.

        dtrp is the address of a 14-byte <u>DateTimeRec</u> structure. Upon return, its fields contain the current year, month, day, etc.

    Returns: none

Notes: **GetTime** calls **GetDateTime** and converts its "raw" seconds value into corresponding <u>DateTimeRec</u>. For example:

```
DateTimeRec   now;                        /* create a 14-byte record */

GetTime( &now );
printf("Today is %d/%d/%d\n", now.month, now.day, now.year );
printf("The first day of the rest of your life. . . ");
```
