ASPCloseSession   Close a workstation/server session

#include <AppleTalk.h>   **AppleTalk Manager**

OSErr   **ASPCloseSession(***xParamBlock, async***);**
XPPParmBlkPtr *xParamBlock*; pointer to an AppleTalk parameter block
Boolean   *async*;   0=await completion; 1=immediate return
               returns   Error Code; 0=no error

   ASPCloseSession closes a session between a workstation and a server.

   xParamBlock is a pointer to a parameter block structure. The relevant fields are
            as follows:

Out-InName	Type	Size	Offset	Description
← csCode	short	2	26	Always**ASPCloseSession**
← sessRefnum	short	2	28	Session reference number

            async is a Boolean value. Use FALSE for normal (synchronous) operation
                 or TRUE to enqueue the request and resume control immediately. See
                 Async I/O.

   Returns: an operating system Error Code. It will be one of:

      aspParamErr   (-1070) Server returned bad (positive) error code
    aspSessClosed (-1072) Session already in process of closing

 Notes: This call aborts any calls that are active on the session, closes the session,
         and calls the attention routine, if any, with an attention code of zero (zero is
         invalid as a real attention code).
