GetMMUMode   Get the current address translation mode

#include <OSUtils.h>   **Operating System Utilities**

char   **GetMMUMode(** *void* **);**

                Returns: a byte that contains the address translation mode
                                      that is currently in use. The two values returned by
                                      GetMMUMode are false32b and true32b.

Notes: **Gestalt** can be used with the gestaltAddressingModeAttr selector to determine
           the current addressing mode as well.
