GetCVariant   Variant control's definition code

#include <Controls.h>   **Control Manager**

short   **GetCVariant(** *theControl* **);**
ControlHandle   *theControl* ;   handle to a control
                          returns   a variant control value

   GetCVariant takes over the job that had been performed by the high four
   bits of the control definition procedure handle.

      theControl specifies which control is being acted upon.

   Returns: a short specifying the variation of the control we want

   ──

   Notes: GetCVariant should be used in place of storing the variant control value in
             the high four bits of the control's definition procedure. For more
             information, see Custom Controls.
